{1} Volatile organic samples need to be filled in multiple VOA vials without air bubbles or headspace.
{2} Dissolved metals require field or lab filtration through 0.45-micron filter prior to preservation. 40 CFR 136.3 requires filtration within 15 minutes.
{3} Volatile organic methods EPA 624 and 8260 require dechlorination using Sodium Thiosulfate (Na2S2O3) at time of sampling if chlorine is present. (Thiosulfate dechlorination bottles are available at the laboratory upon request.) Dechlorination is to occur before transferring to the appropriate VOA.
{4} Volatile organic method EPA 524.2 requires dechlorination using ascorbic acid at time of sampling if chlorine is present. (Ascorbic acid dechlorination kits are available at the laboratory upon request.) If analyzing for THMs only, Sodium Thiosulfate (Na2S2O3) may be used, and acidification can be omitted. Otherwise, dechlorinate with Ascorbic acid, then preserve with HCl. If the sample foams vigorously upon addition of HCl, discard and collect unpreserved dechlorinated sample, and notify the laboratory as the samples must be analyzed within 24 hours of collection if they are to be analyzed for any compounds other than THMs. Method 524.2 requires a travel/trip blank with each sample set collected.
{5} If sampling from a chlorinated location, collect additional bottles with 0.008% Sodium Thiosulfate ($Na_2S_2O_3$) for dechlorination.
{6} Semi Volatile Organics Amber Liters (AL) should be collected in duplicate, to insure volume for re-extraction if necessary. When possible, please collect 4 AL per method to allow the laboratory to perform matrix Quality Control (MS/MSD).
{7} Suspended Sediment Conc.(SSC) requires its own container and the entire contents are used for the analysis.
{8} Preserve with HCl if less than 10 ppth Salinity, or Preserve with H_2SO_4 if greater than 10 ppth Salinity.
{9} Cyhalothrin in water has a 3 day hold time in reagent water per USGS study. Permethrin in water has a 3 day hold time per Storage Stability Study by CA Dept. of Food and Agriculture.
{10} 1000 mL required for RL of 5 mg/L. 250 mL bottle recommended for samples with expected concentrations of 20 mg/L or higher.
{11} If unpreserved, must be analyzed within 7 days of sampling
{12} Hold time can be extended to 14 days if preserved to pH 4-5 at time of collection.

Note: Multiple analyses may be run from the same container, provided that the bottle type, volume and preservation are appropriate.
